

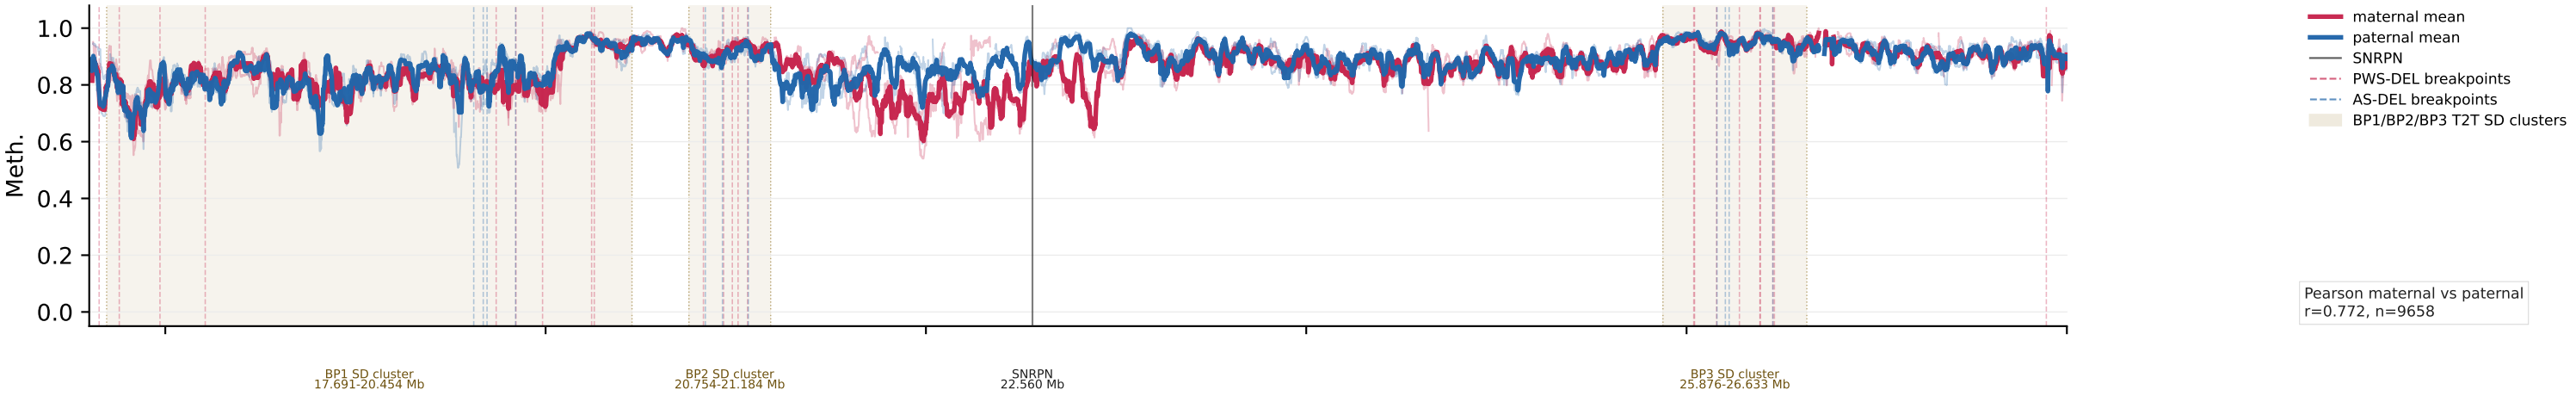

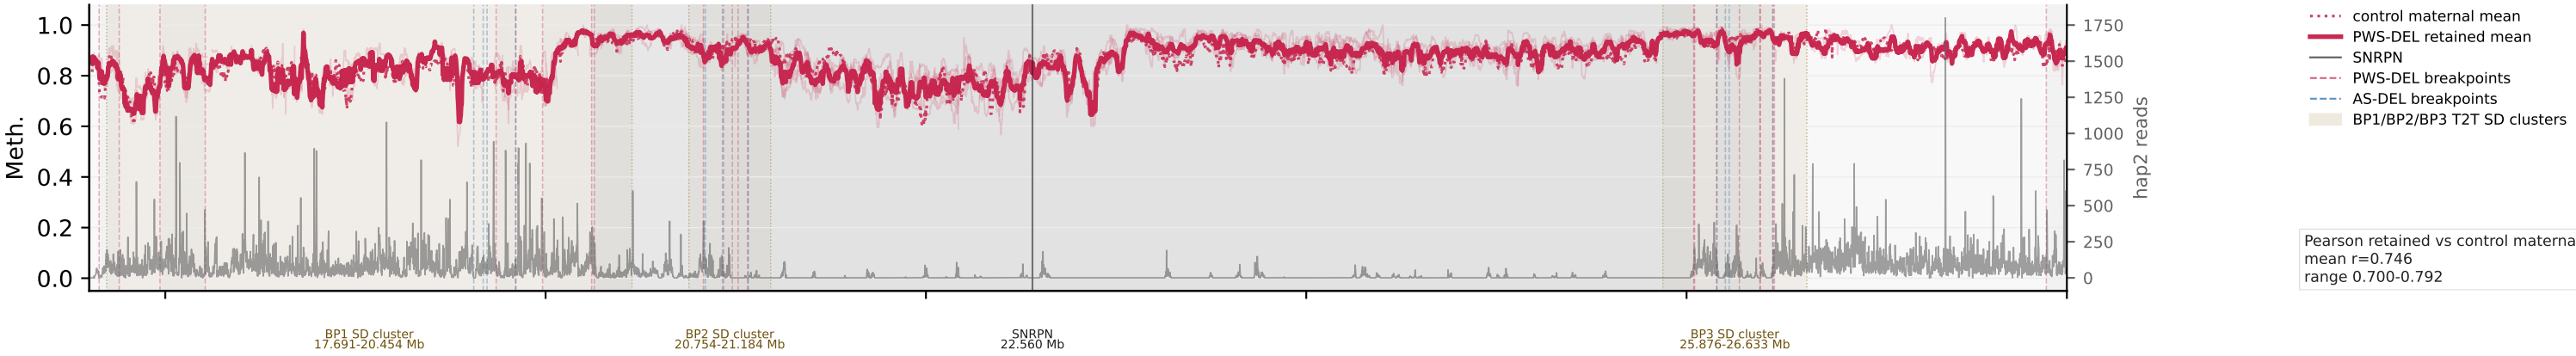

Figure 2. Reciprocal cis-architecture across the chr15 imprinted domain

T2T breakpoint SD clusters shaded in all panels: BP1=17.691-20.454 Mb, BP2=20.754-21.184 Mb, BP3=25.876-26.633 Mb.

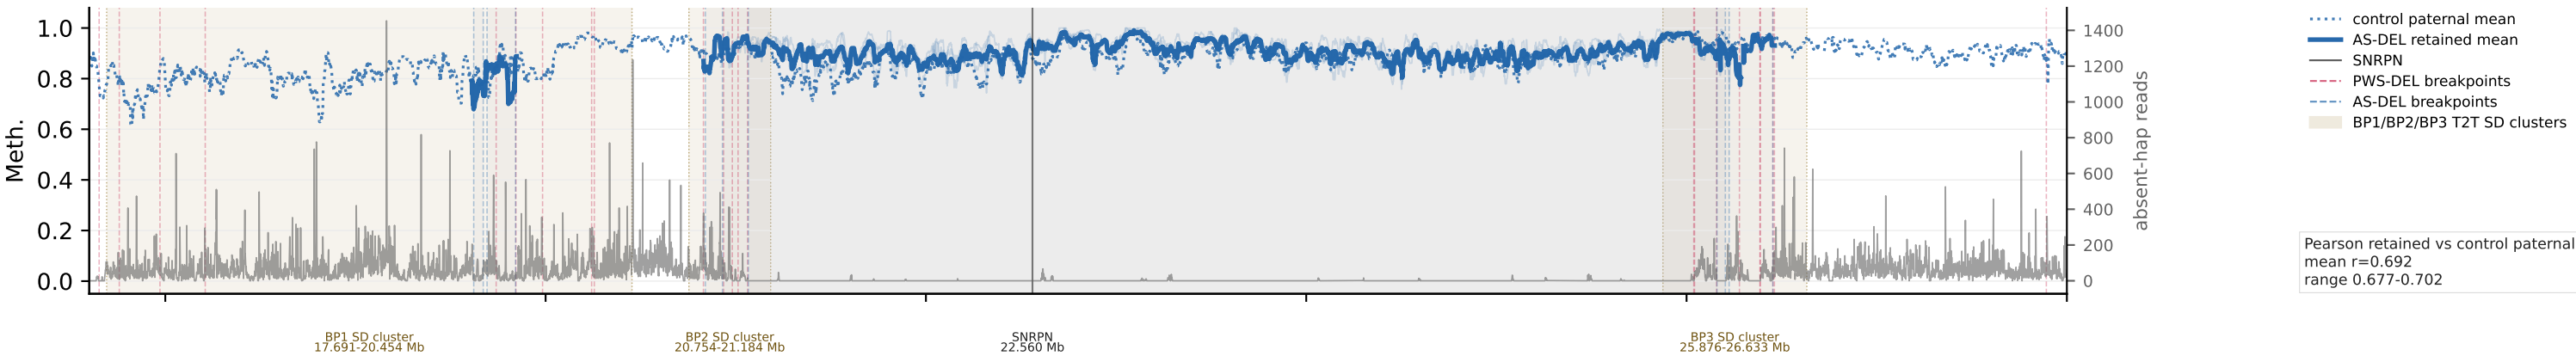

A. Controls: reciprocal maternal and paternal cis-methylation architecture

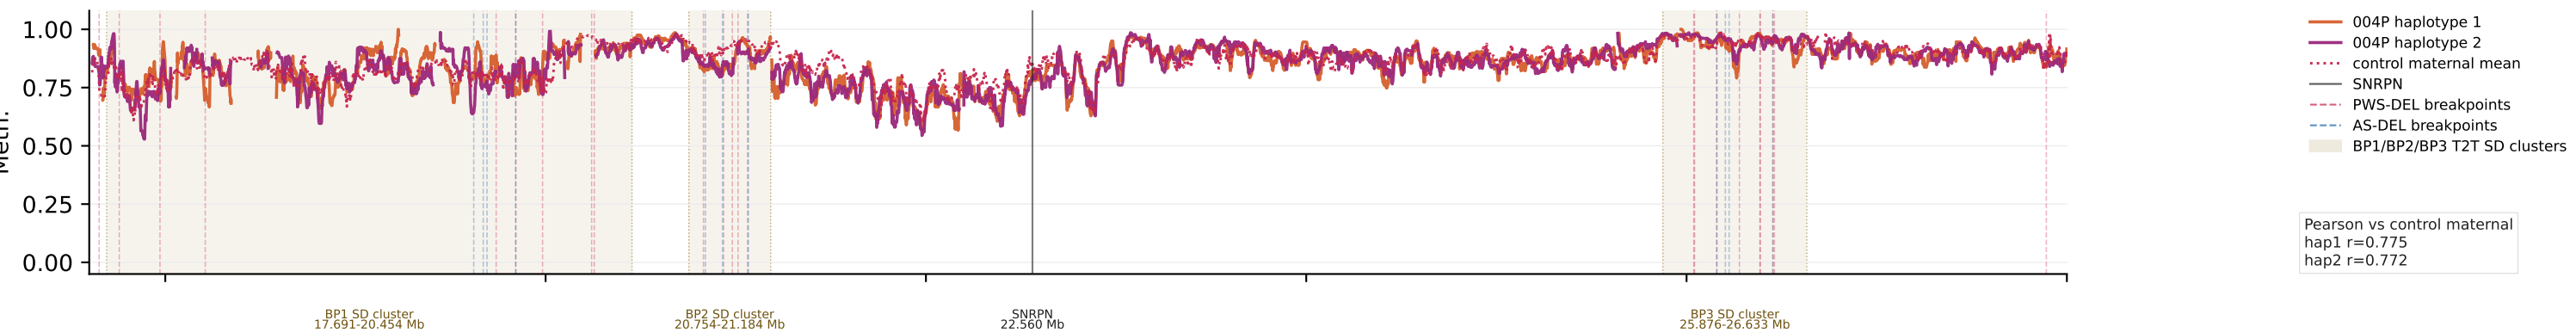

B. PWS-DEL: retained maternal-only architecture across the deletion footprint

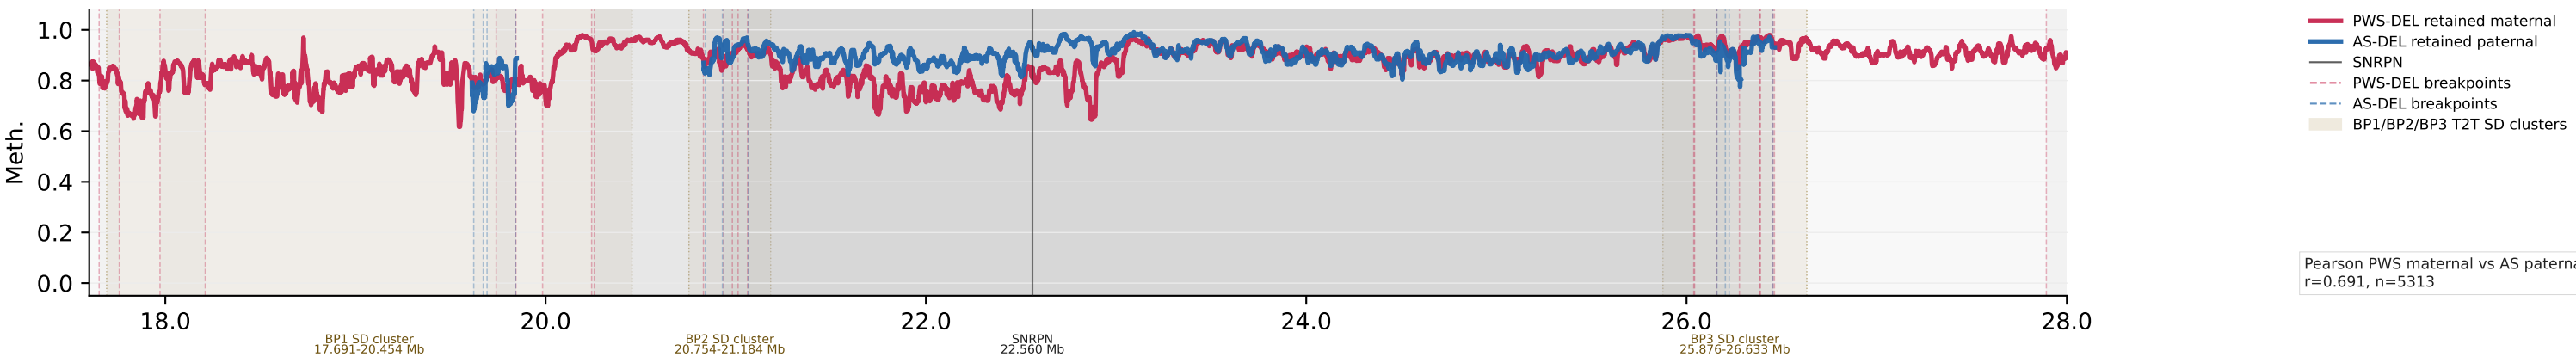

C. AS-DEL: retained paternal-only architecture across the deletion footprint

D. PWS-mUPD: both haplotypes test the duplicated maternal architecture

E. Reciprocal natural dissection: maternal-only and paternal-only signals overlaid
